

### **maximum penalized likelihood estimation pdf**

Intuition. Ordinary linear regression predicts the expected value of a given unknown quantity (the response variable, a random variable) as a linear combination of a set of observed values (predictors). This implies that a constant change in a predictor leads to a constant change in the response variable (i.e. a linear-response model). This is appropriate when the response variable has a normal ...

In statistics, linear regression is a linear approach to modelling the relationship between a scalar response (or dependent variable) and one or more explanatory variables (or independent variables). The case of one explanatory variable is called simple linear regression. For more than one explanatory variable, the process is called multiple linear regression.

This morning I checked Paul Allison's Statistical Horizons blog and found a post on measures for logistic regression. It introduced me to Tjur's by way of an example, which I repackaged.
