The purpose of this study was to examine patterns of exotic species abundance and richness to determine if high exotic cover was correlated with fire frequency. Of particular concern was the potential contribution of firebreaks to the spread of exotic species within the CSS system. In addition, other environmental

by two values: total abundance (N; i.e. the number of individuals in a community) and species richness (S; i.e. the number of species in a community). Though ecological theories often use N and S as inputs to fit or predict the shape of the SAD (McGill 2010), knowing N and S constrains the form of the SAD in ways that ecologists rarely address.

Diversity, Richness, and Evenness In ecology, diversity is usually thought of as being composed of richness – the number of kinds of things, and evenness the relative abundance of things. Most commonly these terms are used with reference to species diversity, a concept that includes species richness (the number of species) and species evenness (the relative abundances of the different species).
